## INTRODUCTION

The Mercury 13 Collection is based on several ladies collections and relates to their participation in the Mercury testing program.

The material fills 6 Hollinger boxes and 5 folders.

There are no restrictions on the use of these materials.

No contact information will be given out without the permission of the woman.

## BIOGRAPHICAL SKETCH

More than 20 years before Sally Ride became the first American woman to fly in space, 13 women pilots successfully completed the tests used in the initial Mercury Astronaut Candidate Testing Program. The first woman to participate, Jerrie Cobb, was even tested in the MASTIF (multiple axis space test inertia facility) at the Lewis Research Center in Cleveland, Ohio.

### Passed With Flying Colors

The testing was initiated by Dr. Randolph Lovelace, who was responsible for screening candidates for the Mercury training program. After testing male candidates, he decided to see if women might also be suitable for spaceflight. The testing began in 1960. Twenty outstanding women pilots were recruited; thirteen successfully completed the initial testing.

One of the participants, B. Steadman of Traverse City, Michigan, says the hardest part of the testing wasn't any of the physical discomforts--such as having ice water injected in the ears or swallowing three feet of rubber tubing--but the overwhelming disappointment she felt when the decision was made to discontinue the testing of women in July, 1961. The decision came after 12 of the women had successfully passed the first phase and were eager to follow Jerrie Cobb who had completed subsequent phases of the testing.

Cobb had logged more than 10,000 hours in the air in all types of aircraft. As an international ferry pilot, she had flown dozens of surplus military planes from Alaska to Europe, or from Canada to South America. She was a flight instructor, held DC-3 captain's ratings, and was a ground instructor in navigation, meteorology, and aircraft engines.

After Cobb passed the grueling physical tests with flying colors and moved on to the next phases of testing, the other women were tested at the Lovelace Clinic two at a time.

"We were sworn to secrecy about the program. We didn't know how many other women were being tested or who they were until an article about the testing appeared in Life magazine in 1963", said Bea Steadman, a commercial pilot who had learned to fly before she learned to drive. "The only other woman I knew was Jane Hart, who was a helicopter pilot, the wife of a U.S. senator from Michigan, and mother of nine." Steadman

had recommended Hart for the testing in order to show that women who had children could be physically well-qualified for spaceflight. Bea Stedman became one of five women who served to found the International Women's Air & Space Museum. In 1986 the museum (IWASM) held the first reunion of the women trainees on the 25<sup>th</sup> anniversary of the Lovelace testing.
